

Demographic, Socioeconomic, Housing and Journey to Work Data for Maryland's House of Delegates Legislative Districts

American Community Survey 2011 – 2015 Five-Year Estimates

Lawrence J. Hogan, *Governor*

Boyd K. Rutherford, *Lt. Governor*

Wendi W. Peters, *Secretary*

Ewing McDowell, *Deputy Secretary*

Description of the Data

What is the American Community Survey (ACS)? What are Five-Year Estimates?

The American Community Survey (ACS) is a nationwide survey designed to collect demographic, social, economic, and housing data every year. The U.S. Census Bureau releases data from the ACS in the form of both single-year and multiyear estimates. Unlike previous Census Bureau data products, the ACS is not concerned with creating population counts, but with collecting data on population characteristics. In the past, population characteristics were collected every ten years through the “long form” of the decennial Census, which was sent to a sample of the total population (approximately one in six households in 2000). The ACS replaces this form with a program that initially sampled 250,000 unique housing unit addresses per month, or 3 million per year. The sampling rate has since been increased with the 2015 ACS sampling 3.54 million unique address. But even after five years of accumulated sampling, the ACS will still have a smaller sample size than the decennial Census, which makes it important to pay attention to margins of error associated with these estimates (see “What is a Margin of Error” below).

This rolling sample allows population characteristics for large areas (those over 65,000 in population) to be reported yearly, instead of once every ten years under the previous “long form” system. Characteristics for areas containing less than 65,000 persons, are reported as five-year period estimates. These differences from the decennial Census mean that ACS data is more timely, but cannot be used to pinpoint a particular point in time (unlike the decennial Census, which is for April 1st of the census year). For more information on the ACS, how the data is collected, and how it should be used, please refer to *A Compass for Understanding and Using American Community Survey Data: What General Data Users Need to Know* (October 2008), available online from the U.S. Census Bureau at: <http://www.census.gov/programs-surveys/acs/guidance/handbooks.html>

What is a Margin of Error (MoE)?

Because the ACS is a sample of a population, its results are subject to sampling error. This error also existed in the previous “long form” but due to the larger sample size it was generally not reported by the Census Bureau. Because of the methodology and the smaller sample sizes used to create the ACS, the reported data may have larger errors than experienced data users are used to seeing. The Census Bureau now reports a margin of error (MoE) based on a 90 percent confidence level that allows data users to understand just how accurate the data is and how it should be used. Generally, five-year period estimates will have a smaller MoE than one-year estimates. Estimates with too few sample cases to create a reliable estimate are marked with the letter “N” in the tables. For more information on this subject, please refer to *American Community Survey Accuracy of the Data (5-year 2011-2015)*, available online from the U.S. Census Bureau at http://www2.census.gov/programs-surveys/acs/tech_docs/accuracy/ACS_Accuracy_of_Data_2015.pdf

On February 24, 2012, Maryland's Legislative Districts, based on Census 2010 redistricting, took effect. The data in this handbook are for these district boundaries. These districts are displayed in the following map. <http://www.mdp.state.md.us/PDF/Redistricting/2010maps/Leg/Statewide.pdf>

Additional data for legislative districts in a profile format can be on the Maryland Department of Planning's State Data Center web site at http://planning.maryland.gov/MSDC/American_Community_Survey/2011-2015ACS.shtml
